

Service information

Reference no.: SDA_108028

Symptom

No function or no heating due to blown NTC circuit SLD

Cure

INFO:
The cause for:

- not heating the water, or
- not heater the water enough (too cold coffee), or
- signalling Boiler too cold (on/off button signaling Water container empty)

Even though the boiler water level sensor / float are OK, can be found in a blown NTC circuit on the PCBA. Please refer to attached image for an overview of the back (solder side) of the PCBA, and the area to inspect.

CURE:
Apart from replacing the PCBA (422225960301), also the NTC (422225947301) itself needs to be replaced as this is most likely the cause for the blown NTC circuit.
