Symptom

The coffee brewing is not correct

Cure

INFO:

The coffee brewing is not correct : sometimes the brewing is not constant, the coffee is dispensed drop by drop or very slowly.

CURE:

If the coffee brewing is not correct, may be that the spring of the portafilter is not assembled correctly (see in image 1 a part sectioned of the portafilter to see the spring incorrectly assembled).

For repair it is necessary to unscrew the three screw, raise up the handle of the portafilter (Image 2) and re-assemble the portafilter so that the spring can go in its correct position, you can check the assembly before and after that operation on a machine to check the reliability of the repair.

Note: Take care about the portafilter phases for the coupling of the handle with the rest of the parts, but if you raise and lower the components with-out rotate one of two part you doesn't lost that phase.
